Abstract The diagnostic category of posttraumatic stress disorder (PTSD) has its place in the newest American diagnostic system DSM-V. The authors compare its definition with the former manual DSM-IV and the international classification ICD-10. They reflect difficulties in defining the concept of traumatic event. They summarize epidemiological findings, highlight the possible significant role of traumatogenesis in other psychiatric disorders without PTSD symptoms. The biopsychosocial model seems to be the most adequate for the study of trauma-related disorders, while in therapy the specific shaping of psychotherapy seems to be crucial. Good experiences in relationships before the trauma increase resilience and the availability of supportive empathetic relationships may favourably influence the development of the disorder and its therapy.

INTRODUCTION

Psychological trauma or repeated traumata can play an important role in the etiology of several mental illnesses. The most characteristic clinical picture resulting from a psychological trauma is described by both the international and American diagnostic systems as posttraumatic stress disorder (PTSD). According to epidemiological studies, incidence of psychological trauma in PTSD represents a serious medical and social problem.

In this short overview, we will first focus on the description of PTSD. In the second part, we describe and discuss the case of our patient. Using

the bio-psycho-social model of mental illness, we will specially focus on its social aspects.

Eye Movement Desensitization and Reprocessing (EMDR) has been recognized as an effective method of reprocessing the psychological consequences of traumatic experiences, especially PTSD. Since its discovery by Francine Shapiro it has been shown that not only eye movements, but also other kinds of bilateral stimulation (bilateral tactile or auditory stimuli) may be effective in trauma treatment.

In case of ongoing traumatization, EMDR as well as other exposure psychotherapeutic methods are considered contraindicated, relatively
